[MOUSE IgG, PROTEIN A PURIFIED](#)

Elevate your assays and diagnostic workflows with LAMPIRE's Mouse IgG. Engineered for ≥95% purity, defined isotype distribution, dependable performance, and lot-to-lot consistency, it's ideal for HAMA blocking in ELISA, Western blot, and flow cytometry as well as other assays. Available in bulk, sample, and research sizes, lyophilized or liquid, with custom buffers or concentrations—LAMPIRE gives you the flexibility to design your workflows exactly how you need them. Reliable, reproducible results every time.

[LAMPIRE BIOLOGICAL LABORATORIES, INC](#) > [SERVICE](#)

[HYBRIDOMA DEVELOPMENT](#)

LAMPIRE offers cost-effective, high-quality hybridoma development services tailored to meet the needs of both industry and academia. Every project begins with a complimentary Antigen Design consultation and detailed Project Scope Meetings conducted by our technical team, including PhDs, project management, and other experts. The process is divided into three phases, each with its own billing cycle. Phase I encompasses project design, immunization, and ELISA titer monitoring. In Phase II, animals are selected for cell fusion, and fusion plates are screened to identify hybridoma cell lines, with your approval required before moving forward. Phase III includes cloning, expanding positive cell lines, and cryopreservation, ensuring over 95% stability in antigen-specific antibody production. LAMPIRE provides efficient and reliable solutions for all your hybridoma development needs.
